

ANNEX I
SUMMARY OF PRODUCT CHARACTERISTICS

1. NAME OF THE MEDICINAL PRODUCT

Emtriva 200 mg hard capsules

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each hard capsule contains 200 mg of emtricitabine.

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Hard capsule.

Each capsule has a white opaque body with a light blue opaque cap, of dimensions 19.4 mm x 6.9 mm. Each capsule is printed with “200 mg” on the cap and “GILEAD” and [Gilead logo] on the body in black ink.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Emtriva is indicated in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus-1 (HIV-1) infected adults and children aged 4 months and over.

This indication is based on studies in treatment-naïve patients and treatment-experienced patients with stable virological control. There is no experience of the use of Emtriva in patients who are failing their current regimen or who have failed multiple regimens (see section 5.1).

When deciding on a new regimen for patients who have failed an antiretroviral regimen, careful consideration should be given to the patterns of mutations associated with different medicinal products and the treatment history of the individual patient. Where available, resistance testing may be appropriate.

4.2 Posology and method of administration

Therapy should be initiated by a physician experienced in the management of HIV infection.

Posology

Emtriva 200 mg hard capsules may be taken with or without food.

Adults: The recommended dose of Emtriva is one 200 mg hard capsule, taken orally, once daily.

If a patient misses a dose of Emtriva within 12 hours of the time it is usually taken, the patient should take Emtriva with or without food as soon as possible and resume their normal dosing schedule. If a patient misses a dose of Emtriva by more than 12 hours and it is almost time for their next dose, the patient should not take the missed dose and simply resume the usual dosing schedule.

If the patient vomits within 1 hour of taking Emtriva, another dose should be taken. If the patient vomits more than 1 hour after taking Emtriva they do not need to take another dose.

Special populations

Elderly: There are no safety and efficacy data available in patients over the age of 65 years. However, no adjustment in the recommended daily dose for adults should be required unless there is evidence of renal insufficiency.

Renal insufficiency: Emtricitabine is eliminated by renal excretion and exposure to emtricitabine was significantly increased in patients with renal insufficiency (see section 5.2). Dose or dose interval adjustment is required in all patients with creatinine clearance < 30 mL/min (see section 4.4).

Table 1 below provides dose interval adjustment guidelines for the 200 mg hard capsules according to the degree of renal insufficiency. The safety and efficacy of the dose interval adjustments to every 72 or 96 hours in patients with creatinine clearance < 30 mL/min have not been clinically evaluated. Therefore, clinical response to treatment and renal function should be closely monitored in these patients (see section 4.4).

Patients with renal insufficiency can also be managed by administration of Emtriva 10 mg/mL oral solution to provide a reduced daily dose of emtricitabine. Please refer to the Summary of Product Characteristics for Emtriva 10 mg/mL oral solution.

Table 1: Dose interval guidelines for 200 mg hard capsules adjusted according to creatinine clearance

	Creatinine clearance (mL/min)		
	≥ 30	15-29	< 15 (functionally anephric, requiring intermittent haemodialysis)*
Recommended dose interval for 200 mg hard capsules	One 200 mg hard capsule every 24 hours	One 200 mg hard capsule every 72 hours	One 200 mg hard capsule every 96 hours

* Assumes a 3-hour haemodialysis session three times a week commencing at least 12 h after administration of the last dose of emtricitabine.

Patients with end-stage renal disease (ESRD) managed with other forms of dialysis such as ambulatory peritoneal dialysis have not been studied and no dose recommendations can be made.

Hepatic insufficiency: No data are available on which to make a dose recommendation for patients with hepatic insufficiency. However, based on the minimal metabolism of emtricitabine and the renal route of elimination it is unlikely that a dose adjustment would be required in patients with hepatic insufficiency (see section 5.2).

If Emtriva is discontinued in patients co-infected with HIV and hepatitis B virus (HBV), these patients should be closely monitored for evidence of exacerbation of hepatitis (see section 4.4).

Paediatric population: The recommended dose of Emtriva for children aged 4 months and over and adolescents up to 18 years of age weighing at least 33 kg who are able to swallow hard capsules is one 200 mg hard capsule, taken orally, once daily.

There are no data regarding the efficacy and only very limited data regarding the safety of emtricitabine in infants below 4 months of age. Therefore Emtriva is not recommended for use in those aged less than 4 months (for pharmacokinetic data in this age group, see section 5.2).

No data are available on which to make a dose recommendation in paediatric patients with renal insufficiency.

Method of administration

Emtriva 200 mg hard capsules should be taken once daily, orally with or without food.

Emtriva is also available as a 10 mg/mL oral solution for use in infants aged 4 months and over, children and patients who are unable to swallow hard capsules and patients with renal insufficiency. Please refer to the Summary of Product Characteristics for Emtriva 10 mg/mL oral solution. Due to a difference in the bioavailability of emtricitabine between the hard capsule and oral solution presentations, 240 mg emtricitabine administered as the oral solution should provide similar plasma levels to those observed after administration of one 200 mg emtricitabine hard capsule (see section 5.2).

4.3 Contraindications

Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.

4.4 Special warnings and precautions for use

General

Emtricitabine is not recommended as monotherapy for the treatment of HIV infection. It must be used in combination with other antiretrovirals. Please also refer to the Summaries of Product Characteristics of the other antiretroviral medicinal products used in the combination regimen.

Co-administration of other medicinal products

Emtriva should not be taken with any other medicinal products containing emtricitabine or medicinal products containing lamivudine.

Opportunistic infections

Patients receiving emtricitabine or any other antiretroviral therapy may continue to develop opportunistic infections and other complications of HIV infection, and therefore should remain under close clinical observation by physicians experienced in the treatment of patients with HIV associated diseases.

Transmission of HIV

While effective viral suppression with antiretroviral therapy has been proven to substantially reduce the risk of sexual transmission, a residual risk cannot be excluded. Precautions to prevent transmission should be taken in accordance with national guidelines.

Renal function

Emtricitabine is principally eliminated by the kidney via glomerular filtration and active tubular secretion. Emtricitabine exposure may be markedly increased in patients with severe renal insufficiency (creatinine clearance < 30 mL/min) receiving daily doses of 200 mg emtricitabine as hard capsules or 240 mg as the oral solution. Consequently, either a dose interval adjustment (using Emtriva 200 mg hard capsules) or a reduction in the daily dose of emtricitabine (using Emtriva 10 mg/mL oral solution) is required in all patients with creatinine clearance < 30 mL/min. The safety and efficacy of the dose interval adjustment guidelines provided in section 4.2 are based on single dose pharmacokinetic data and modelling and have not been clinically evaluated. Therefore, clinical response to treatment and renal function should be closely monitored in patients treated with emtricitabine at prolonged dosing intervals (see sections 4.2 and 5.2).

Caution should be exercised when emtricitabine is co-administered with medicinal products that are eliminated by active tubular secretion as such co-administration may lead to an increase in serum concentrations of either emtricitabine or a co-administered medicinal product, due to competition for this elimination pathway (see section 4.5).

Weight and metabolic parameters

An increase in weight and in levels of blood lipids and glucose may occur during antiretroviral therapy. Such changes may in part be linked to disease control and life style. For lipids, there is in some cases evidence for a treatment effect, while for weight gain there is no strong evidence relating this to any particular treatment. For monitoring of blood lipids and glucose reference is made to established HIV treatment guidelines. Lipid disorders should be managed as clinically appropriate.

Liver function

Patients with pre-existing liver dysfunction including chronic active hepatitis have an increased frequency of liver function abnormalities during combination antiretroviral therapy (CART) and should be monitored according to standard practice. Patients with chronic hepatitis B or C infection treated with CART are at increased risk of experiencing severe, and potentially fatal, hepatic adverse events. In case of concomitant antiviral therapy for hepatitis B or C, please also refer to the relevant Summary of Product Characteristics for these medicinal products.

If there is evidence of exacerbations of liver disease in such patients, interruption or discontinuation of treatment must be considered.

Patients co-infected with HBV

Emtricitabine is active *in vitro* against HBV. However, limited data are available on the efficacy and safety of emtricitabine (as a 200 mg hard capsule once daily) in patients who are co-infected with HIV and HBV. The use of emtricitabine in patients with chronic HBV induces the same mutation pattern in the YMDD motif observed with lamivudine therapy. The YMDD mutation confers resistance to both emtricitabine and lamivudine.

Patients co-infected with HIV and HBV should be closely monitored with both clinical and laboratory follow-up for at least several months after stopping treatment with emtricitabine for evidence of exacerbations of hepatitis. Such exacerbations have been seen following discontinuation of emtricitabine treatment in HBV infected patients without concomitant HIV infection and have been detected primarily by serum alanine aminotransferase (ALT) elevations in addition to re-emergence of HBV DNA. In some of these patients, HBV reactivation was associated with more severe liver disease, including decompensation and liver failure. There is insufficient evidence to determine whether re-initiation of emtricitabine alters the course of post-treatment exacerbations of hepatitis. In patients with advanced liver disease or cirrhosis, treatment discontinuation is not recommended since post-treatment exacerbations of hepatitis may lead to hepatic decompensation.

Mitochondrial dysfunction following exposure *in utero*

Nucleos(t)ide analogues may impact mitochondrial function to a variable degree, which is most pronounced with stavudine, didanosine and zidovudine. There have been reports of mitochondrial dysfunction in HIV negative infants exposed *in utero* and/or postnatally to nucleoside analogues; these have predominantly concerned treatment with regimens containing zidovudine. The main adverse reactions reported are haematological disorders (anaemia, neutropenia) and metabolic disorders (hyperlactatemia, hyperlipasemia). These events have often been transitory. Late onset neurological disorders have been reported rarely (hypertonia, convulsion, abnormal behaviour). Whether such neurological disorders are transient or permanent is currently unknown. These findings should be considered for any child exposed *in utero* to nucleos(t)ide analogues, who present with severe clinical findings of unknown etiology, particularly neurologic findings. These findings do not affect current national recommendations to use antiretroviral therapy in pregnant women to prevent vertical transmission of HIV.

Immune Reactivation Syndrome

In HIV infected patients with severe immune deficiency at the time of institution of CART, an inflammatory reaction to asymptomatic or residual opportunistic pathogens may arise and cause serious clinical conditions, or aggravation of symptoms. Typically, such reactions have been observed within the first few weeks or months of initiation of CART. Relevant examples include cytomegalovirus retinitis, generalised and/or focal mycobacterial infections, and *Pneumocystis jirovecii* pneumonia. Any inflammatory symptoms should be evaluated and treatment instituted when necessary.

Autoimmune disorders (such as Graves' disease and autoimmune hepatitis) have also been reported to occur in the setting of immune reactivation; however, the reported time to onset is more variable and these events can occur many months after initiation of treatment.

Osteonecrosis

Although the etiology is considered to be multifactorial (including corticosteroid use, alcohol consumption, severe immunosuppression, higher body mass index), cases of osteonecrosis have been reported particularly in patients with advanced HIV disease and/or long-term exposure to CART. Patients should be advised to seek medical advice if they experience joint aches and pain, joint stiffness or difficulty in movement.

Elderly

Emtriva has not been studied in patients over the age of 65. Elderly patients are more likely to have decreased renal function; therefore caution should be exercised when treating elderly patients with Emtriva.

Paediatric population

In addition to the adverse reactions experienced by adults, anaemia and skin discolouration occurred more frequently in clinical trials involving HIV infected paediatric patients (see section 4.8).

4.5 Interaction with other medicinal products and other forms of interaction

Interaction studies have only been performed in adults.

In vitro, emtricitabine did not inhibit metabolism mediated by any of the following human CYP450 isoforms: 1A2, 2A6, 2B6, 2C9, 2C19, 2D6 and 3A4. Emtricitabine did not inhibit the enzyme responsible for glucuronidation. Based on the results of these *in vitro* experiments and the known elimination pathways of emtricitabine, the potential for CYP450 mediated interactions involving emtricitabine with other medicinal products is low.

There are no clinically significant interactions when emtricitabine is co-administered with indinavir, zidovudine, stavudine, famciclovir or tenofovir disoproxil fumarate.

Emtricitabine is primarily excreted via glomerular filtration and active tubular secretion. With the exception of famciclovir and tenofovir disoproxil fumarate, the effect of co-administration of emtricitabine with medicinal products that are excreted by the renal route, or other medicinal products known to affect renal function, has not been evaluated. Co-administration of emtricitabine with medicinal products that are eliminated by active tubular secretion may lead to an increase in serum concentrations of either emtricitabine or a co-administered medicinal product due to competition for this elimination pathway.

There is no clinical experience as yet on the co-administration of cytidine analogues. Consequently, the use of emtricitabine in combination with lamivudine for the treatment of HIV infection cannot be recommended at this time.

4.6 Fertility, pregnancy and lactation

Pregnancy

A moderate amount of data on pregnant women (between 300 and 1,000 pregnancy outcomes) indicate no malformations or foetal/neonatal toxicity associated with emtricitabine. Animal studies do not indicate reproductive toxicity. The use of emtricitabine may be considered during pregnancy, if necessary.

Breast-feeding

Emtricitabine has been shown to be excreted in human milk. There is insufficient information on the effects of emtricitabine in newborns/infants. Therefore Emtriva should not be used during breast-feeding.

As a general rule, it is recommended that HIV infected women do not breast-feed their infants under any circumstances in order to avoid transmission of HIV to the infant.

Fertility

No human data on the effect of emtricitabine are available. Animal studies do not indicate harmful effects of emtricitabine on fertility.

4.7 Effects on ability to drive and use machines

No studies on the effects on the ability to drive and use machines have been performed. However, patients should be informed that dizziness has been reported during treatment with emtricitabine.

4.8 Undesirable effects

Summary of the safety profile

In clinical trials of HIV infected adults, the most frequently occurring adverse reactions to emtricitabine were diarrhoea (14.0%), headache (10.2%), elevated creatine kinase (10.2%) and nausea (10.0%). In addition to the adverse reactions reported in adults, anaemia (9.5%) and skin discolouration (31.8%) occurred more frequently in clinical trials involving HIV infected paediatric patients.

Discontinuation of Emtriva therapy in patients co-infected with HIV and HBV may be associated with severe acute exacerbations of hepatitis (see section 4.4).

Tabulated summary of adverse reactions

Assessment of adverse reactions from clinical study data is based on experience in three studies in adults (n = 1,479) and three paediatric studies (n = 169). In the adult studies, 1,039 treatment-naïve and 440 treatment-experienced patients received emtricitabine (n = 814) or comparator medicinal product (n = 665) for 48 weeks in combination with other antiretroviral medicinal products.

The adverse reactions with suspected (at least possible) relationship to treatment in adults from clinical trial and post-marketing experience are listed in Table 2 below by body system organ class and frequency. Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness. Frequencies are defined as very common ($\geq 1/10$), common ($\geq 1/100$ to $< 1/10$) or uncommon ($\geq 1/1,000$ to $< 1/100$).

Table 2: Tabulated summary of adverse reactions associated with emtricitabine based on clinical study and post-marketing experience

Frequency	Emtricitabine
<i>Blood and lymphatic system disorders:</i>	
Common:	neutropenia
Uncommon:	anaemia ²
<i>Immune system disorders:</i>	
Common:	allergic reaction
<i>Metabolism and nutrition disorders:</i>	
Common:	hypertriglyceridaemia, hyperglycaemia
<i>Psychiatric disorders:</i>	
Common:	insomnia, abnormal dreams
<i>Nervous system disorders:</i>	
Very common:	headache
Common:	dizziness
<i>Gastrointestinal disorders:</i>	
Very common:	diarrhoea, nausea
Common:	elevated amylase including elevated pancreatic amylase, elevated serum lipase, vomiting, abdominal pain, dyspepsia
<i>Hepatobiliary disorders:</i>	
Common:	elevated serum aspartate aminotransferase (AST) and/or elevated serum ALT, hyperbilirubinaemia

Frequency	Emtricitabine
<i>Skin and subcutaneous tissue disorders:</i>	
Common:	vesiculobullous rash, pustular rash, maculopapular rash, rash, pruritus, urticaria, skin discolouration (increased pigmentation) ^{1,2}
Uncommon:	angioedema ³
<i>Musculoskeletal and connective tissue disorders:</i>	
Very common:	elevated creatine kinase
<i>General disorders and administration site conditions:</i>	
Common:	pain, asthenia

¹ See section 4.8, *Description of selected adverse reactions* for more details.

² Anaemia was common and skin discolouration (increased pigmentation) was very common when emtricitabine was administered to paediatric patients (see section 4.8, *Paediatric population*).

³ This adverse reaction, which was identified through post-marketing surveillance, was not observed in randomised controlled clinical trials in adults or paediatric HIV clinical trials of emtricitabine. The frequency category of uncommon was estimated from a statistical calculation based on the total number of patients exposed to emtricitabine in these clinical studies (n = 1,563).

Description of selected adverse reactions

Skin discolouration (increased pigmentation): Skin discolouration, manifested by hyperpigmentation mainly on the palms and/or soles, was generally mild, asymptomatic and of little clinical significance. The mechanism is unknown.

Metabolic parameters: Weight and levels of blood lipids and glucose may increase during antiretroviral therapy (see section 4.4).

Immune Reactivation Syndrome: In HIV infected patients with severe immune deficiency at the time of initiation of CART, an inflammatory reaction to asymptomatic or residual opportunistic infections may arise. Autoimmune disorders (such as Graves' disease and autoimmune hepatitis) have also been reported; however, the reported time to onset is more variable and these events can occur many months after initiation of treatment (see section 4.4).

Osteonecrosis: Cases of osteonecrosis have been reported, particularly in patients with generally acknowledged risk factors, advanced HIV disease or long-term exposure to CART. The frequency of this is unknown (see section 4.4).

Paediatric population

Assessment of adverse reactions in paediatric patients from clinical study data is based on experience in three paediatric studies (n = 169) where treatment-naïve (n = 123) and treatment-experienced (n = 46) paediatric HIV infected patients aged 4 months to 18 years were treated with emtricitabine in combination with other antiretroviral agents.

In addition to the adverse reactions reported in adults (see section 4.8, *Tabulated summary of adverse reactions*), the following adverse reactions were observed more frequently in paediatric patients: anaemia was common (9.5%) and skin discolouration (increased pigmentation) was very common (31.8%) in paediatric patients.

Other special population(s)

Elderly: Emtriva has not been studied in patients over the age of 65. Elderly patients are more likely to have decreased renal function, therefore caution should be exercised when treating elderly patients with Emtriva (see section 4.2).

Patients with renal impairment: Emtricitabine is eliminated by renal excretion and exposure to emtricitabine was significantly increased in patients with renal insufficiency. Dose or dose interval adjustment is required in all patients with creatinine clearance < 30 mL/min (see sections 4.2, 4.4 and 5.2).

HIV/HBV co-infected patients: The adverse reaction profile in patients co-infected with HBV is similar to that observed in patients infected with HIV without co-infection with HBV. However, as

would be expected in this patient population, elevations in AST and ALT occurred more frequently than in the general HIV infected population.

Exacerbations of hepatitis after discontinuation of treatment: In HIV infected patients co-infected with HBV, exacerbations of hepatitis may occur after discontinuation of treatment (see section 4.4).

Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the national reporting system listed in Appendix V.

4.9 Overdose

Administration of up to 1,200 mg emtricitabine has been associated with the adverse reactions listed above (see section 4.8).

If overdose occurs, the patient should be monitored for signs of toxicity and standard supportive treatment applied as necessary.

Up to 30% of the emtricitabine dose can be removed by haemodialysis. It is not known whether emtricitabine can be removed by peritoneal dialysis.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Nucleoside and nucleotide reverse transcriptase inhibitors, ATC code: J05AF09

Mechanism of action and pharmacodynamic effects

Emtricitabine is a synthetic nucleoside analogue of cytidine with activity that is specific to HIV-1, HIV-2 and HBV.

Emtricitabine is phosphorylated by cellular enzymes to form emtricitabine 5'-triphosphate, which competitively inhibits HIV-1 reverse transcriptase, resulting in DNA chain termination. Emtricitabine is a weak inhibitor of mammalian DNA polymerase α , β and ϵ and mitochondrial DNA polymerase γ .

Emtricitabine did not exhibit cytotoxicity to peripheral blood mononuclear cells (PBMCs), established lymphocyte and monocyte-macrophage cell lines or bone marrow progenitor cells *in vitro*. There was no evidence of toxicity to mitochondria *in vitro* or *in vivo*.

Antiviral activity in vitro: The 50% inhibitory concentration (IC₅₀) value for emtricitabine against laboratory and clinical isolates of HIV-1 was in the range of 0.0013 to 0.5 $\mu\text{mol/l}$. In combination studies of emtricitabine with protease inhibitors (PIs), nucleoside, nucleotide and non-nucleoside analogue inhibitors of HIV reverse transcriptase, additive to synergistic effects were observed. Most of these combinations have not been studied in humans.

When tested for activity against laboratory strains of HBV, the IC₅₀ value for emtricitabine was in the range of 0.01 to 0.04 $\mu\text{mol/l}$.

Resistance: HIV-1 resistance to emtricitabine develops as the result of changes at codon 184 causing the methionine to be changed to a valine (an isoleucine intermediate has also been observed) of the HIV reverse transcriptase. This HIV-1 mutation was observed *in vitro* and in HIV-1 infected patients.

Emtricitabine-resistant viruses were cross-resistant to lamivudine, but retained sensitivity to other nucleoside reverse transcriptase inhibitors (NRTIs) (zidovudine, stavudine, tenofovir, abacavir and didanosine), all non-nucleoside reverse transcriptase inhibitors (NNRTIs) and all PIs. Viruses resistant to zidovudine, didanosine and NNRTIs retained their sensitivity to emtricitabine ($IC_{50} = 0.002 \mu\text{mol/l}$ to $0.08 \mu\text{mol/l}$).

Clinical efficacy and safety

Emtricitabine in combination with other antiretroviral agents, including nucleoside analogues, non-nucleoside analogues and PIs, has been shown to be effective in the treatment of HIV infection in treatment-naïve patients and treatment-experienced patients with stable virological control. There is no experience of the use of emtricitabine in patients who are failing their current regimen or who have failed multiple regimens.

In antiretroviral treatment-naïve adults, emtricitabine was significantly superior to stavudine when both medicinal products were taken in combination with didanosine and efavirenz through 48 weeks of treatment. Phenotypic analysis showed no significant changes in emtricitabine susceptibility unless the M184V/I mutation had developed.

In virologically stable treatment-experienced adults, emtricitabine, in combination with an NRTI (either stavudine or zidovudine) and a PI or an NNRTI was shown to be non-inferior to lamivudine with respect to the proportion of responders (< 400 copies/mL) through 48 weeks (77% emtricitabine, 82% lamivudine). Additionally, in a second study, treatment-experienced adults on a stable PI-based highly active antiretroviral therapy (HAART) regimen were randomised to a once daily regimen containing emtricitabine or to continue with their PI-HAART regimen. At 48 weeks of treatment the emtricitabine-containing regimen demonstrated an equivalent proportion of patients with HIV RNA < 400 copies/mL (94% emtricitabine *versus* 92%) and a greater proportion of patients with HIV RNA < 50 copies/mL (95% emtricitabine *versus* 87%) compared with the patients continuing with their PI-HAART regimen.

Paediatric population

In infants and children older than 4 months, the majority of patients achieved or maintained complete suppression of plasma HIV-1 RNA through 48 weeks (89% achieved ≤ 400 copies/mL and 77% achieved ≤ 50 copies/mL).

There is no clinical experience of the use of emtricitabine in infants less than 4 months of age.

5.2 Pharmacokinetic properties

Absorption

Emtricitabine is rapidly and extensively absorbed following oral administration with peak plasma concentrations occurring at 1 to 2 hours post-dose. In 20 HIV infected subjects receiving 200 mg emtricitabine daily as hard capsules, steady-state plasma emtricitabine peak concentrations (C_{max}), trough concentrations (C_{min}) and area under the plasma concentration time curve over a 24-hour dosing interval (AUC) were $1.8 \pm 0.7 \mu\text{g/mL}$, $0.09 \pm 0.07 \mu\text{g/mL}$ and $10.0 \pm 3.1 \mu\text{g}\cdot\text{h/mL}$, respectively. Steady-state trough plasma concentrations reached levels approximately 4-fold above the *in vitro* IC_{90} values for anti-HIV activity.

The absolute bioavailability of emtricitabine from Emtriva 200 mg hard capsules was estimated to be 93% and the absolute bioavailability from Emtriva 10 mg/mL oral solution was estimated to be 75%.

In a pilot study in children and a definitive bioequivalence study in adults, the Emtriva 10 mg/mL oral solution was shown to have approximately 80% of the bioavailability of the Emtriva 200 mg hard capsules. The reason for this difference is unknown. Due to this difference in bioavailability, 240 mg emtricitabine administered as the oral solution should provide similar plasma levels to those observed after administration of one 200 mg emtricitabine hard capsule. Therefore, children who weigh at least 33 kg may take either one 200 mg hard capsule daily or the oral solution up to a maximum dose of 240 mg (24 mL), once daily.

Administration of Emtriva 200 mg hard capsules with a high-fat meal or administration of Emtriva 10 mg/mL oral solution with a low-fat or high-fat meal did not affect systemic exposure ($AUC_{0-\infty}$) of emtricitabine; therefore Emtriva 200 mg hard capsules and Emtriva 10 mg/mL oral solution may be administered with or without food.

Distribution

In vitro binding of emtricitabine to human plasma proteins was < 4% and independent of concentration over the range of 0.02-200 $\mu\text{g/mL}$. The mean plasma to blood concentration ratio was approximately 1.0 and the mean semen to plasma concentration ratio was approximately 4.0.

The apparent volume of distribution after intravenous administration of emtricitabine was 1.4 ± 0.3 L/kg, indicating that emtricitabine is widely distributed throughout the body to both intracellular and extracellular fluid spaces.

Biotransformation

There is limited metabolism of emtricitabine. The biotransformation of emtricitabine includes oxidation of the thiol moiety to form the 3'-sulphoxide diastereomers (approximately 9% of dose) and conjugation with glucuronic acid to form 2'-O-glucuronide (approximately 4% of dose).

Emtricitabine did not inhibit *in vitro* drug metabolism mediated by the following human CYP450 isoenzymes: 1A2, 2A6, 2B6, 2C9, 2C19, 2D6 and 3A4.

Also, emtricitabine did not inhibit uridine-5'-diphosphoglucuronyl transferase, the enzyme responsible for glucuronidation.

Elimination

Emtricitabine is primarily excreted by the kidneys with complete recovery of the dose achieved in urine (approximately 86%) and faeces (approximately 14%). Thirteen percent of the emtricitabine dose was recovered in urine as three metabolites. The systemic clearance of emtricitabine averaged 307 mL/min (4.03 mL/min/kg). Following oral administration, the elimination half-life of emtricitabine is approximately 10 hours.

Linearity/non-linearity

The pharmacokinetics of emtricitabine are proportional to dose over the dose range of 25-200 mg following single or repeated administration.

Intracellular pharmacokinetics: In a clinical study, the intracellular half-life of emtricitabine-triphosphate in PBMCs was 39 hours. Intracellular triphosphate levels increased with dose, but reached a plateau at doses of 200 mg or greater.

Adults with renal insufficiency

Pharmacokinetic parameters were determined following administration of a single dose of 200 mg emtricitabine hard capsules to 30 non-HIV infected subjects with varying degrees of renal insufficiency. Subjects were grouped according to baseline creatinine clearance (> 80 mL/min as normal function; 50-80 mL/min as mild impairment; 30-49 mL/min as moderate impairment; < 30 mL/min as severe impairment; < 15 mL/min as functionally anephric requiring haemodialysis).

The systemic emtricitabine exposure (mean \pm standard deviation) increased from 11.8 ± 2.9 $\mu\text{g}\cdot\text{h/mL}$ in subjects with normal renal function to 19.9 ± 1.1 , 25.0 ± 5.7 and 34.0 ± 2.1 $\mu\text{g}\cdot\text{h/mL}$, in patients with mild, moderate and severe renal impairment, respectively.

In patients with ESRD on haemodialysis, approximately 30% of the emtricitabine dose was recovered in dialysate over a 3-hour dialysis period which had been started within 1.5 hours of emtricitabine dosing (blood flow rate of 400 mL/min and dialysate flow rate of approximately 600 mL/min).

Hepatic insufficiency

The pharmacokinetics of emtricitabine have not been studied in non-HBV infected subjects with varying degrees of hepatic insufficiency. In general, emtricitabine pharmacokinetics in HBV infected subjects were similar to those in healthy subjects and in HIV infected subjects.

Age

Pharmacokinetic data are not available in the elderly (over 65 years of age).

Gender

Although the mean C_{max} and C_{min} were approximately 20% higher and mean AUC was 16% higher in females compared to males, this difference was not considered clinically significant.

Ethnicity

No clinically important pharmacokinetic difference due to ethnicity has been identified.

Paediatric population

In general, the pharmacokinetics of emtricitabine in infants, children and adolescents (aged 4 months up to 18 years) are similar to those seen in adults.

The mean AUC in 77 infants, children and adolescents receiving 6 mg/kg emtricitabine once daily as oral solution or 200 mg emtricitabine as hard capsules once daily was similar to the mean AUC of 10.0 $\mu\text{g}\cdot\text{h/mL}$ in 20 adults receiving 200 mg hard capsules once daily.

In an open-label, non-comparative study, pharmacokinetic data were obtained from 20 neonates of HIV infected mothers who received two 4-day courses of emtricitabine oral solution between the first week of life and 3 months of age at a dose level of 3 mg/kg once daily. This dose is half of that approved for infants aged 4 months and over (6 mg/kg). The apparent total body clearance at steady-state (CL/F) increased with age over the 3-month period with a corresponding decrease in AUC. Plasma emtricitabine exposure (AUC) in infants up to 3 months of age who received 3 mg/kg emtricitabine once daily was similar to that observed using 6 mg/kg daily doses in HIV infected adults and children aged 4 months and over.

5.3 Preclinical safety data

Non-clinical data on emtricitabine reveal no special hazard for humans based on conventional studies of safety pharmacology, repeated dose toxicity, genotoxicity, carcinogenic potential, and toxicity to reproduction and development.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Capsule contents

Crospovidone
Magnesium stearate (E572)
Microcrystalline cellulose (E460)
Povidone (E1201)

Capsule shell

Gelatin
Indigotine (E132)
Titanium dioxide (E171)

Printing ink containing

Black iron oxide (E172)
Shellac (E904)

6.2 Incompatibilities

Not applicable.

6.3 Shelf life

3 years.

6.4 Special precautions for storage

This medicinal product does not require any special storage conditions.

6.5 Nature and contents of container

High density polyethylene (HDPE) bottle with a polypropylene child-resistant closure, containing 30 hard capsules.

Blisters made of polychlorotrifluoroethylene (PCTFE) / polyethylene (PE) / polyvinylchloride (PVC) / aluminium. Each blister pack contains 30 hard capsules.

Pack size: 30 hard capsules.

6.6 Special precautions for disposal

Any unused medicinal product or waste material should be disposed of in accordance with local requirements.

7. MARKETING AUTHORISATION HOLDER

Gilead Sciences Ireland UC
Carrigtohill
County Cork, T45 DP77
Ireland

8. MARKETING AUTHORISATION NUMBER(S)

EU/1/03/261/001
EU/1/03/261/002

9. DATE OF FIRST AUTHORISATION/RENEWAL OF THE AUTHORISATION

Date of first authorisation: 24 October 2003
Date of latest renewal: 22 September 2008

10. DATE OF REVISION OF THE TEXT

Detailed information on this medicinal product is available on the website of the European Medicines Agency <http://www.ema.europa.eu>.

1. NAME OF THE MEDICINAL PRODUCT

Emtriva 10 mg/mL oral solution

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each mL of Emtriva oral solution contains 10 mg of emtricitabine.

Excipient(s) with known effect

Each dose (24 mL) contains 36 mg methyl parahydroxybenzoate (E218), 3.6 mg propyl parahydroxybenzoate (E216), 1.2 mg sunset yellow (E110), 480 mg propylene glycol and has a sodium content of 36 mg.

For the full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Oral solution.

The clear solution is orange to dark orange in colour.

4. CLINICAL PARTICULARS

4.1 Therapeutic indications

Emtriva is indicated in combination with other antiretroviral medicinal products for the treatment of human immunodeficiency virus-1 (HIV-1) infected adults and children aged 4 months and over.

This indication is based on studies in treatment-naïve patients and treatment-experienced patients with stable virological control. There is no experience of the use of Emtriva in patients who are failing their current regimen or who have failed multiple regimens (see section 5.1).

When deciding on a new regimen for patients who have failed an antiretroviral regimen, careful consideration should be given to the patterns of mutations associated with different medicinal products and the treatment history of the individual patient. Where available, resistance testing may be appropriate.

4.2 Posology and method of administration

Therapy should be initiated by a physician experienced in the management of HIV infection.

Posology

Emtriva 10 mg/mL oral solution may be taken with or without food. A measuring cup is provided (see section 6.5).

Adults: The recommended dose of Emtriva 10 mg/mL oral solution is 240 mg (24 mL) once daily.

If a patient misses a dose of Emtriva within 12 hours of the time it is usually taken, the patient should take Emtriva with or without food as soon as possible and resume their normal dosing schedule. If a patient misses a dose of Emtriva by more than 12 hours and it is almost time for their next dose, the patient should not take the missed dose and simply resume the usual dosing schedule.

If the patient vomits within 1 hour of taking Emtriva, another dose should be taken. If the patient vomits more than 1 hour after taking Emtriva they do not need to take another dose.

Emtriva 200 mg hard capsules are available for adults, adolescents and children who weigh at least 33 kg and can swallow hard capsules. Please refer to the Summary of Product Characteristics for Emtriva 200 mg hard capsules. Due to a difference in the bioavailability of emtricitabine between the hard capsule and oral solution presentations, 240 mg emtricitabine administered as the oral solution (24 mL) should provide similar plasma levels to those observed after administration of one 200 mg emtricitabine hard capsule (see section 5.2).

Special populations

Elderly: There are no safety and efficacy data available in patients over the age of 65 years. However, no adjustment in the recommended daily dose for adults should be required unless there is evidence of renal insufficiency.

Renal insufficiency: Emtricitabine is eliminated by renal excretion and exposure to emtricitabine was significantly increased in patients with renal insufficiency (see section 5.2). Dose or dose interval adjustment is required in all patients with creatinine clearance < 30 mL/min (see section 4.4).

Table 1 below provides daily doses of Emtriva 10 mg/mL oral solution according to the degree of renal insufficiency. The safety and efficacy of these doses have not been clinically evaluated. Therefore, clinical response to treatment and renal function should be closely monitored in these patients (see section 4.4).

Patients with renal insufficiency can also be managed by administration of Emtriva 200 mg hard capsules at modified dose intervals. Please refer to the Summary of Product Characteristics for Emtriva 200 mg hard capsules.

Table 1: Daily doses of Emtriva 10 mg/mL oral solution adjusted according to creatinine clearance

	Creatinine clearance (mL/min)		
	≥ 30	15-29	< 15 (functionally anephric, requiring intermittent haemodialysis)*
Recommended dose of Emtriva 10 mg/mL oral solution every 24 hours	240 mg (24 mL)	80 mg (8 mL)	60 mg (6 mL)

* Assumes a 3-hour haemodialysis session three times a week commencing at least 12 h after administration of the last dose of emtricitabine.

Patients with end-stage renal disease (ESRD) managed with other forms of dialysis such as ambulatory peritoneal dialysis have not been studied and no dose recommendations can be made.

Hepatic insufficiency: No data are available on which to make a dose recommendation for patients with hepatic insufficiency. However, based on the minimal metabolism of emtricitabine and the renal route of elimination it is unlikely that a dose adjustment would be required in patients with hepatic insufficiency (see section 5.2).

If Emtriva is discontinued in patients co-infected with HIV and hepatitis B virus (HBV), these patients should be closely monitored for evidence of exacerbation of hepatitis (see section 4.4).

Paediatric population: The recommended dose of Emtriva 10 mg/mL oral solution is 6 mg/kg up to a maximum of 240 mg (24 mL) once daily.

Children aged 4 months and over, who weigh at least 33 kg may either take one 200 mg hard capsule daily or may take emtricitabine as the oral solution up to a maximum of 240 mg once daily.

There are no data regarding the efficacy and only very limited data regarding the safety of emtricitabine in infants below 4 months of age. Therefore Emtriva is not recommended for use in those aged less than 4 months (for pharmacokinetic data in this age group, see section 5.2).

No data are available on which to make a dose recommendation in paediatric patients with renal insufficiency.

Method of administration

Emtriva 10 mg/mL oral solution should be taken once daily, orally with or without food. A measuring cup is provided (see section 6.5).

4.3 Contraindications

Hypersensitivity to the active substance or to any of the excipients listed in section 6.1.

4.4 Special warnings and precautions for use

General

Emtricitabine is not recommended as monotherapy for the treatment of HIV infection. It must be used in combination with other antiretrovirals. Please also refer to the Summaries of Product Characteristics of the other antiretroviral medicinal products used in the combination regimen.

Co-administration of other medicinal products

Emtriva should not be taken with any other medicinal products containing emtricitabine or medicinal products containing lamivudine.

Opportunistic infections

Patients receiving emtricitabine or any other antiretroviral therapy may continue to develop opportunistic infections and other complications of HIV infection, and therefore should remain under close clinical observation by physicians experienced in the treatment of patients with HIV associated diseases.

Transmission of HIV

While effective viral suppression with antiretroviral therapy has been proven to substantially reduce the risk of sexual transmission, a residual risk cannot be excluded. Precautions to prevent transmission should be taken in accordance with national guidelines.

Renal function

Emtricitabine is principally eliminated by the kidney via glomerular filtration and active tubular secretion. Emtricitabine exposure may be markedly increased in patients with severe renal insufficiency (creatinine clearance < 30 mL/min) receiving daily doses of 200 mg emtricitabine as hard capsules or 240 mg as the oral solution. Consequently, either a dose interval adjustment (using Emtriva 200 mg hard capsules) or a reduction in the daily dose of emtricitabine (using Emtriva 10 mg/mL oral solution) is required in all patients with creatinine clearance < 30 mL/min. The safety and efficacy of the reduced doses provided in section 4.2 are based on single dose pharmacokinetic data and modelling and have not been clinically evaluated. Therefore, clinical response to treatment and renal function should be closely monitored in patients treated with a reduced dose of emtricitabine (see sections 4.2 and 5.2).

Caution should be exercised when emtricitabine is co-administered with medicinal products that are eliminated by active tubular secretion as such co-administration may lead to an increase in serum concentrations of either emtricitabine or a co-administered medicinal product, due to competition for this elimination pathway (see section 4.5).

Weight and metabolic parameters

An increase in weight and in levels of blood lipids and glucose may occur during antiretroviral therapy. Such changes may in part be linked to disease control and life style. For lipids, there is in some cases evidence for a treatment effect, while for weight gain there is no strong evidence relating this to any particular treatment. For monitoring of blood lipids and glucose reference is made to established HIV treatment guidelines. Lipid disorders should be managed as clinically appropriate.

Liver function

Patients with pre-existing liver dysfunction including chronic active hepatitis have an increased frequency of liver function abnormalities during combination antiretroviral therapy (CART) and should be monitored according to standard practice. Patients with chronic hepatitis B or C infection treated with CART are at increased risk of experiencing severe, and potentially fatal, hepatic adverse events. In case of concomitant antiviral therapy for hepatitis B or C, please also refer to the relevant Summary of Product Characteristics for these medicinal products.

If there is evidence of exacerbations of liver disease in such patients, interruption or discontinuation of treatment must be considered.

Patients co-infected with HBV

Emtricitabine is active *in vitro* against HBV. However, limited data are available on the efficacy and safety of emtricitabine (as a 200 mg hard capsule once daily) in patients who are co-infected with HIV and HBV. The use of emtricitabine in patients with chronic HBV induces the same mutation pattern in the YMDD motif observed with lamivudine therapy. The YMDD mutation confers resistance to both emtricitabine and lamivudine.

Patients co-infected with HIV and HBV should be closely monitored with both clinical and laboratory follow-up for at least several months after stopping treatment with emtricitabine for evidence of exacerbations of hepatitis. Such exacerbations have been seen following discontinuation of emtricitabine treatment in HBV infected patients without concomitant HIV infection and have been detected primarily by serum alanine aminotransferase (ALT) elevations in addition to re-emergence of HBV DNA. In some of these patients, HBV reactivation was associated with more severe liver disease, including decompensation and liver failure. There is insufficient evidence to determine whether re-initiation of emtricitabine alters the course of post-treatment exacerbations of hepatitis. In patients with advanced liver disease or cirrhosis, treatment discontinuation is not recommended since post-treatment exacerbations of hepatitis may lead to hepatic decompensation.

Mitochondrial dysfunction following exposure *in utero*

Nucleos(t)ide analogues may impact mitochondrial function to a variable degree, which is most pronounced with stavudine, didanosine and zidovudine. There have been reports of mitochondrial dysfunction in HIV negative infants exposed *in utero* and/or postnatally to nucleoside analogues; these have predominantly concerned treatment with regimens containing zidovudine. The main adverse reactions reported are haematological disorders (anaemia, neutropenia) and metabolic disorders (hyperlactatemia, hyperlipasemia). These events have often been transitory. Late onset neurological disorders have been reported rarely (hypertonia, convulsion, abnormal behaviour). Whether such neurological disorders are transient or permanent is currently unknown. These findings should be considered for any child exposed *in utero* to nucleos(t)ide analogues, who present with severe clinical findings of unknown etiology, particularly neurologic findings. These findings do not affect current national recommendations to use antiretroviral therapy in pregnant women to prevent vertical transmission of HIV.

Immune Reactivation Syndrome

In HIV infected patients with severe immune deficiency at the time of institution of CART, an inflammatory reaction to asymptomatic or residual opportunistic pathogens may arise and cause serious clinical conditions, or aggravation of symptoms. Typically, such reactions have been observed within the first few weeks or months of initiation of CART. Relevant examples include cytomegalovirus retinitis, generalised and/or focal mycobacterial infections, and *Pneumocystis*

jirovecii pneumonia. Any inflammatory symptoms should be evaluated and treatment instituted when necessary.

Autoimmune disorders (such as Graves' disease and autoimmune hepatitis) have also been reported to occur in the setting of immune reactivation; however, the reported time to onset is more variable and these events can occur many months after initiation of treatment.

Osteonecrosis

Although the etiology is considered to be multifactorial (including corticosteroid use, alcohol consumption, severe immunosuppression, higher body mass index), cases of osteonecrosis have been reported particularly in patients with advanced HIV disease and/or long-term exposure to CART. Patients should be advised to seek medical advice if they experience joint aches and pain, joint stiffness or difficulty in movement.

Emtriva oral solution contains sunset yellow (E110) which may cause allergic reactions, methyl parahydroxybenzoate (E218) and propyl parahydroxybenzoate (E216) which may cause allergic reactions (possibly delayed). This medicinal product contains 36 mg of sodium per 24 mL, equivalent to 1.8% of the WHO recommended maximum daily intake of 2 g sodium for an adult.

Elderly

Emtriva has not been studied in patients over the age of 65. Elderly patients are more likely to have decreased renal function; therefore caution should be exercised when treating elderly patients with Emtriva.

Paediatric population

In addition to the adverse reactions experienced by adults, anaemia and skin discolouration occurred more frequently in clinical trials involving HIV infected paediatric patients (see section 4.8).

4.5 Interaction with other medicinal products and other forms of interaction

Interaction studies have only been performed in adults.

In vitro, emtricitabine did not inhibit metabolism mediated by any of the following human CYP450 isoforms: 1A2, 2A6, 2B6, 2C9, 2C19, 2D6 and 3A4. Emtricitabine did not inhibit the enzyme responsible for glucuronidation. Based on the results of these *in vitro* experiments and the known elimination pathways of emtricitabine, the potential for CYP450 mediated interactions involving emtricitabine with other medicinal products is low.

There are no clinically significant interactions when emtricitabine is co-administered with indinavir, zidovudine, stavudine, famciclovir or tenofovir disoproxil fumarate.

Emtricitabine is primarily excreted via glomerular filtration and active tubular secretion. With the exception of famciclovir and tenofovir disoproxil fumarate, the effect of co-administration of emtricitabine with medicinal products that are excreted by the renal route, or other medicinal products known to affect renal function, has not been evaluated. Co-administration of emtricitabine with medicinal products that are eliminated by active tubular secretion may lead to an increase in serum concentrations of either emtricitabine or a co-administered medicinal product due to competition for this elimination pathway.

There is no clinical experience as yet on the co-administration of cytidine analogues. Consequently, the use of emtricitabine in combination with lamivudine for the treatment of HIV infection cannot be recommended at this time.

4.6 Fertility, pregnancy and lactation

Pregnancy

A moderate amount of data on pregnant women (between 300 and 1,000 pregnancy outcomes) indicate no malformations or foetal/neonatal toxicity associated with emtricitabine. Animal studies do not indicate reproductive toxicity. The use of emtricitabine may be considered during pregnancy, if necessary.

Breast-feeding

Emtricitabine has been shown to be excreted in human milk. There is insufficient information on the effects of emtricitabine in newborns/infants. Therefore Emtriva should not be used during breast-feeding.

As a general rule, it is recommended that HIV infected women do not breast-feed their infants under any circumstances in order to avoid transmission of HIV to the infant.

Fertility

No human data on the effect of emtricitabine are available. Animal studies do not indicate harmful effects of emtricitabine on fertility.

4.7 Effects on ability to drive and use machines

No studies on the effects on the ability to drive and use machines have been performed. However, patients should be informed that dizziness has been reported during treatment with emtricitabine.

4.8 Undesirable effects

Summary of the safety profile

In clinical trials of HIV infected adults, the most frequently occurring adverse reactions to emtricitabine were diarrhoea (14.0%), headache (10.2%), elevated creatine kinase (10.2%) and nausea (10.0%). In addition to the adverse reactions reported in adults, anaemia (9.5%) and skin discolouration (31.8%) occurred more frequently in clinical trials involving HIV infected paediatric patients.

Discontinuation of Emtriva therapy in patients co-infected with HIV and HBV may be associated with severe acute exacerbations of hepatitis (see section 4.4).

Tabulated summary of adverse reactions

Assessment of adverse reactions from clinical study data is based on experience in three studies in adults (n = 1,479) and three paediatric studies (n = 169). In the adult studies, 1,039 treatment-naïve and 440 treatment-experienced patients received emtricitabine (n = 814) or comparator medicinal product (n = 665) for 48 weeks in combination with other antiretroviral medicinal products.

The adverse reactions with suspected (at least possible) relationship to treatment in adults from clinical trial and post-marketing experience are listed in Table 2 below by body system organ class and frequency. Within each frequency grouping, undesirable effects are presented in order of decreasing seriousness. Frequencies are defined as very common ($\geq 1/10$), common ($\geq 1/100$ to $< 1/10$) or uncommon ($\geq 1/1,000$ to $< 1/100$).

Table 2: Tabulated summary of adverse reactions associated with emtricitabine based on clinical study and post-marketing experience

Frequency	Emtricitabine
Blood and lymphatic system disorders:	
Common:	neutropenia
Uncommon:	anaemia ²
Immune system disorders:	
Common:	allergic reaction
Metabolism and nutrition disorders:	
Common:	hypertriglyceridaemia, hyperglycaemia
Psychiatric disorders:	
Common:	insomnia, abnormal dreams
Nervous system disorders:	
Very common:	headache
Common:	dizziness
Gastrointestinal disorders:	
Very common:	diarrhoea, nausea
Common:	elevated amylase including elevated pancreatic amylase, elevated serum lipase, vomiting, abdominal pain, dyspepsia
Hepatobiliary disorders:	
Common:	elevated serum aspartate aminotransferase (AST) and/or elevated serum ALT, hyperbilirubinaemia
Skin and subcutaneous tissue disorders:	
Common:	vesiculobullous rash, pustular rash, maculopapular rash, rash, pruritus, urticaria, skin discolouration (increased pigmentation) ^{1,2}
Uncommon:	angioedema ³
Musculoskeletal and connective tissue disorders:	
Very common:	elevated creatine kinase
General disorders and administration site conditions:	
Common:	pain, asthenia

¹ See section 4.8, *Description of selected adverse reactions* for more details.

² Anaemia was common and skin discolouration (increased pigmentation) was very common when emtricitabine was administered to paediatric patients (see section 4.8, *Paediatric population*).

³ This adverse reaction, which was identified through post-marketing surveillance, was not observed in randomised controlled clinical trials in adults or paediatric HIV clinical trials of emtricitabine. The frequency category of uncommon was estimated from a statistical calculation based on the total number of patients exposed to emtricitabine in these clinical studies (n = 1,563).

Description of selected adverse reactions

Skin discolouration (increased pigmentation): Skin discolouration, manifested by hyperpigmentation mainly on the palms and/or soles, was generally mild, asymptomatic and of little clinical significance. The mechanism is unknown.

Metabolic parameters: Weight and levels of blood lipids and glucose may increase during antiretroviral therapy (see section 4.4).

Immune Reactivation Syndrome: In HIV infected patients with severe immune deficiency at the time of initiation of CART, an inflammatory reaction to asymptomatic or residual opportunistic infections may arise. Autoimmune disorders (such as Graves' disease and autoimmune hepatitis) have also been reported; however, the reported time to onset is more variable and these events can occur many months after initiation of treatment (see section 4.4).

Osteonecrosis: Cases of osteonecrosis have been reported, particularly in patients with generally acknowledged risk factors, advanced HIV disease or long-term exposure to CART. The frequency of this is unknown (see section 4.4).

Paediatric population

Assessment of adverse reactions in paediatric patients from clinical study data is based on experience in three paediatric studies (n = 169) where treatment-naïve (n = 123) and treatment-experienced

(n = 46) paediatric HIV infected patients aged 4 months to 18 years were treated with emtricitabine in combination with other antiretroviral agents.

In addition to the adverse reactions reported in adults (see section 4.8, *Tabulated summary of adverse reactions*), the following adverse reactions were observed more frequently in paediatric patients: anaemia was common (9.5%) and skin discolouration (increased pigmentation) was very common (31.8%) in paediatric patients.

Other special population(s)

Elderly: Emtriva has not been studied in patients over the age of 65. Elderly patients are more likely to have decreased renal function, therefore caution should be exercised when treating elderly patients with Emtriva (see section 4.2).

Patients with renal impairment: Emtricitabine is eliminated by renal excretion and exposure to emtricitabine was significantly increased in patients with renal insufficiency. Dose or dose interval adjustment is required in all patients with creatinine clearance < 30 mL/min (see sections 4.2, 4.4 and 5.2).

HIV/HBV co-infected patients: The adverse reaction profile in patients co-infected with HBV is similar to that observed in patients infected with HIV without co-infection with HBV. However, as would be expected in this patient population, elevations in AST and ALT occurred more frequently than in the general HIV infected population.

Exacerbations of hepatitis after discontinuation of treatment: In HIV infected patients co-infected with HBV, exacerbations of hepatitis may occur after discontinuation of treatment (see section 4.4).

Reporting of suspected adverse reactions

Reporting suspected adverse reactions after authorisation of the medicinal product is important. It allows continued monitoring of the benefit/risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions via the national reporting system listed in Appendix V.

4.9 Overdose

Administration of up to 1,200 mg emtricitabine has been associated with the adverse reactions listed above (see section 4.8).

If overdose occurs, the patient should be monitored for signs of toxicity and standard supportive treatment applied as necessary.

Up to 30% of the emtricitabine dose can be removed by haemodialysis. It is not known whether emtricitabine can be removed by peritoneal dialysis.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Nucleoside and nucleotide reverse transcriptase inhibitors, ATC code: J05AF09

Mechanism of action and pharmacodynamic effects

Emtricitabine is a synthetic nucleoside analogue of cytidine with activity that is specific to HIV-1, HIV-2 and HBV.

Emtricitabine is phosphorylated by cellular enzymes to form emtricitabine 5'-triphosphate, which competitively inhibits HIV-1 reverse transcriptase, resulting in DNA chain termination. Emtricitabine is a weak inhibitor of mammalian DNA polymerase α , β and ϵ and mitochondrial DNA polymerase γ .

Emtricitabine did not exhibit cytotoxicity to peripheral blood mononuclear cells (PBMCs), established lymphocyte and monocyte-macrophage cell lines or bone marrow progenitor cells *in vitro*. There was no evidence of toxicity to mitochondria *in vitro* or *in vivo*.

Antiviral activity in vitro: The 50% inhibitory concentration (IC₅₀) value for emtricitabine against laboratory and clinical isolates of HIV-1 was in the range of 0.0013 to 0.5 $\mu\text{mol/l}$. In combination studies of emtricitabine with protease inhibitors (PIs), nucleoside, nucleotide and non-nucleoside analogue inhibitors of HIV reverse transcriptase, additive to synergistic effects were observed. Most of these combinations have not been studied in humans.

When tested for activity against laboratory strains of HBV, the IC₅₀ value for emtricitabine was in the range of 0.01 to 0.04 $\mu\text{mol/l}$.

Resistance: HIV-1 resistance to emtricitabine develops as the result of changes at codon 184 causing the methionine to be changed to a valine (an isoleucine intermediate has also been observed) of the HIV reverse transcriptase. This HIV-1 mutation was observed *in vitro* and in HIV-1 infected patients.

Emtricitabine-resistant viruses were cross-resistant to lamivudine, but retained sensitivity to other nucleoside reverse transcriptase inhibitors (NRTIs) (zidovudine, stavudine, tenofovir, abacavir and didanosine), all non-nucleoside reverse transcriptase inhibitors (NNRTIs) and all PIs. Viruses resistant to zidovudine, didanosine and NNRTIs retained their sensitivity to emtricitabine (IC₅₀= 0.002 $\mu\text{mol/l}$ to 0.08 $\mu\text{mol/l}$).

Clinical efficacy and safety

Emtricitabine in combination with other antiretroviral agents, including nucleoside analogues, non-nucleoside analogues and PIs, has been shown to be effective in the treatment of HIV infection in treatment-naïve patients and treatment-experienced patients with stable virological control. There is no experience of the use of emtricitabine in patients who are failing their current regimen or who have failed multiple regimens.

In antiretroviral treatment-naïve adults, emtricitabine was significantly superior to stavudine when both medicinal products were taken in combination with didanosine and efavirenz through 48 weeks of treatment. Phenotypic analysis showed no significant changes in emtricitabine susceptibility unless the M184V/I mutation had developed.

In virologically stable treatment-experienced adults, emtricitabine, in combination with an NRTI (either stavudine or zidovudine) and a protease inhibitor (PI) or an NNRTI was shown to be non-inferior to lamivudine with respect to the proportion of responders (< 400 copies/mL) through 48 weeks (77% emtricitabine, 82% lamivudine). Additionally, in a second study, treatment-experienced adults on a stable PI based highly active antiretroviral therapy (HAART) regimen were randomised to a once daily regimen containing emtricitabine or to continue with their PI-HAART regimen. At 48 weeks of treatment the emtricitabine-containing regimen demonstrated an equivalent proportion of patients with HIV RNA < 400 copies/mL (94% emtricitabine *versus* 92%) and a greater proportion of patients with HIV RNA < 50 copies/mL (95% emtricitabine *versus* 87%) compared with the patients continuing with their PI-HAART regimen.

Paediatric population

In infants and children older than 4 months, the majority of patients achieved or maintained complete suppression of plasma HIV-1 RNA through 48 weeks (89% achieved \leq 400 copies/mL and 77% achieved \leq 50 copies/mL).

There is no clinical experience of the use of emtricitabine in infants less than 4 months of age.

5.2 Pharmacokinetic properties

Absorption

Emtricitabine is rapidly and extensively absorbed following oral administration with peak plasma concentrations occurring at 1 to 2 hours post-dose. In 20 HIV infected subjects receiving 200 mg emtricitabine daily as hard capsules, steady-state plasma emtricitabine peak concentrations (C_{max}), trough concentrations (C_{min}) and area under the plasma concentration time curve over a 24-hour dosing interval (AUC) were $1.8 \pm 0.7 \mu\text{g/mL}$, $0.09 \pm 0.07 \mu\text{g/mL}$ and $10.0 \pm 3.1 \mu\text{g}\cdot\text{h/mL}$, respectively. Steady-state trough plasma concentrations reached levels approximately 4-fold above the *in vitro* IC_{90} values for anti-HIV activity.

The absolute bioavailability of emtricitabine from Emtriva 200 mg hard capsules was estimated to be 93% and the absolute bioavailability from Emtriva 10 mg/mL oral solution was estimated to be 75%.

In a pilot study in children and a definitive bioequivalence study in adults, the Emtriva 10 mg/mL oral solution was shown to have approximately 80% of the bioavailability of the Emtriva 200 mg hard capsules. The reason for this difference is unknown. Due to this difference in bioavailability, 240 mg emtricitabine administered as the oral solution should provide similar plasma levels to those observed after administration of one 200 mg emtricitabine hard capsule. Therefore, children who weigh at least 33 kg may take either one 200 mg hard capsule daily or the oral solution up to a maximum dose of 240 mg (24 mL), once daily.

Administration of Emtriva 200 mg hard capsules with a high-fat meal or administration of Emtriva 10 mg/mL oral solution with a low-fat or high-fat meal did not affect systemic exposure ($AUC_{0-\infty}$) of emtricitabine; therefore Emtriva 200 mg hard capsules and Emtriva 10 mg/mL oral solution may be administered with or without food.

Distribution

In vitro binding of emtricitabine to human plasma proteins was $< 4\%$ and independent of concentration over the range of 0.02-200 $\mu\text{g/mL}$. The mean plasma to blood concentration ratio was approximately 1.0 and the mean semen to plasma concentration ratio was approximately 4.0.

The apparent volume of distribution after intravenous administration of emtricitabine was $1.4 \pm 0.3 \text{ L/kg}$, indicating that emtricitabine is widely distributed throughout the body to both intracellular and extracellular fluid spaces.

Biotransformation

There is limited metabolism of emtricitabine. The biotransformation of emtricitabine includes oxidation of the thiol moiety to form the 3'-sulphoxide diastereomers (approximately 9% of dose) and conjugation with glucuronic acid to form 2'-O-glucuronide (approximately 4% of dose).

Emtricitabine did not inhibit *in vitro* drug metabolism mediated by the following human CYP450 isoenzymes: 1A2, 2A6, 2B6, 2C9, 2C19, 2D6 and 3A4.

Also, emtricitabine did not inhibit uridine-5'-diphosphoglucuronyl transferase, the enzyme responsible for glucuronidation.

Elimination

Emtricitabine is primarily excreted by the kidneys with complete recovery of the dose achieved in urine (approximately 86%) and faeces (approximately 14%). Thirteen percent of the emtricitabine dose was recovered in urine as three metabolites. The systemic clearance of emtricitabine averaged 307 mL/min (4.03 mL/min/kg). Following oral administration, the elimination half-life of emtricitabine is approximately 10 hours.

Linearity/non-linearity

The pharmacokinetics of emtricitabine are proportional to dose over the dose range of 25-200 mg following single or repeated administration.

Intracellular pharmacokinetics: In a clinical study, the intracellular half-life of emtricitabine-triphosphate in PBMCs was 39 hours. Intracellular triphosphate levels increased with dose, but reached a plateau at doses of 200 mg or greater.

Adults with renal insufficiency

Pharmacokinetic parameters were determined following administration of a single dose of 200 mg emtricitabine hard capsules to 30 non-HIV infected subjects with varying degrees of renal insufficiency. Subjects were grouped according to baseline creatinine clearance (> 80 mL/min as normal function; 50-80 mL/min as mild impairment; 30-49 mL/min as moderate impairment; < 30 mL/min as severe impairment; < 15 mL/min as functionally anephric requiring haemodialysis).

The systemic emtricitabine exposure (mean \pm standard deviation) increased from 11.8 ± 2.9 $\mu\text{g}\cdot\text{h/mL}$ in subjects with normal renal function to 19.9 ± 1.1 , 25.0 ± 5.7 and 34.0 ± 2.1 $\mu\text{g}\cdot\text{h/mL}$, in patients with mild, moderate and severe renal impairment, respectively.

In patients with ESRD on haemodialysis, approximately 30% of the emtricitabine dose was recovered in dialysate over a 3 hour dialysis period which had been started within 1.5 hours of emtricitabine dosing (blood flow rate of 400 mL/min and dialysate flow rate of approximately 600 mL/min).

Hepatic insufficiency

The pharmacokinetics of emtricitabine have not been studied in non-HBV infected subjects with varying degrees of hepatic insufficiency. In general, emtricitabine pharmacokinetics in HBV infected subjects were similar to those in healthy subjects and in HIV infected subjects.

Age

Pharmacokinetic data are not available in the elderly (over 65 years of age).

Gender

Although the mean C_{max} and C_{min} were approximately 20% higher and mean AUC was 16% higher in females compared to males, this difference was not considered clinically significant.

Ethnicity

No clinically important pharmacokinetic difference due to ethnicity has been identified.

Paediatric population

In general, the pharmacokinetics of emtricitabine in infants, children and adolescents (aged 4 months up to 18 years) are similar to those seen in adults.

The mean AUC in 77 infants, children and adolescents receiving 6 mg/kg emtricitabine once daily as oral solution or 200 mg emtricitabine as hard capsules once daily was similar to the mean AUC of 10.0 $\mu\text{g}\cdot\text{h/mL}$ in 20 adults receiving 200 mg hard capsules once daily.

In an open-label, non-comparative study, pharmacokinetic data were obtained from 20 neonates of HIV infected mothers who received two 4-day courses of emtricitabine oral solution between the first week of life and 3 months of age at a dose level of 3 mg/kg once daily. This dose is half of that approved for infants aged 4 months and over (6 mg/kg). The apparent total body clearance at steady-state (CL/F) increased with age over the 3-month period with a corresponding decrease in AUC. Plasma emtricitabine exposure (AUC) in infants up to 3 months of age who received 3 mg/kg emtricitabine once daily was similar to that observed using 6 mg/kg daily doses in HIV infected adults and children aged 4 months and over.

5.3 Preclinical safety data

Non-clinical data on emtricitabine reveal no special hazard for humans based on conventional studies of safety pharmacology, repeated dose toxicity, genotoxicity, carcinogenic potential, and toxicity to reproduction and development.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients

Cotton candy flavouring
Disodium edetate
Hydrochloric acid
Methyl parahydroxybenzoate (E218)
Propylene glycol
Propyl parahydroxybenzoate (E216)
Sodium hydroxide
Sodium phosphate monobasic hydrate
Sunset yellow (E110)
Purified water
Xylitol (E967)

6.2 Incompatibilities

Not applicable.

6.3 Shelf life

3 years.

After first opening: 45 days.

6.4 Special precautions for storage

Store in a refrigerator (2°C – 8°C).

After opening: Do not store above 25°C.

6.5 Nature and contents of container

Amber-coloured polyethylene terephthalate (PET) bottle with a child-resistant closure. The pack also contains a 30 mL polypropylene measuring cup with 1.0 mL graduations. The bottle contains 170 mL of solution.

6.6 Special precautions for disposal

Patients should be instructed that any solution left in the bottle 45 days after opening should be disposed of in accordance with local requirements or returned to the pharmacy.

7. MARKETING AUTHORISATION HOLDER

Gilead Sciences Ireland UC
Carrigtohill
County Cork, T45 DP77
Ireland

8. MARKETING AUTHORISATION NUMBER(S)

EU/1/03/261/003

9. DATE OF FIRST AUTHORISATION/RENEWAL OF THE AUTHORISATION

Date of first authorisation: 24 October 2003

Date of latest renewal: 22 September 2008

10. DATE OF REVISION OF THE TEXT

Detailed information on this medicinal product is available on the website of the European Medicines Agency <http://www.ema.europa.eu>.

ANNEX II

- A. MANUFACTURER(S) RESPONSIBLE FOR BATCH RELEASE**
- B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE**
- C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION**
- D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT**

A. MANUFACTURER(S) RESPONSIBLE FOR BATCH RELEASE

Name and address of the manufacturer(s) responsible for batch release

Gilead Sciences Ireland UC
IDA Business & Technology Park
Carrigtohill
County Cork
Ireland

B. CONDITIONS OR RESTRICTIONS REGARDING SUPPLY AND USE

Medicinal product subject to restricted medical prescription (see Annex I: Summary of Product Characteristics, section 4.2).

C. OTHER CONDITIONS AND REQUIREMENTS OF THE MARKETING AUTHORISATION

The holder of this marketing authorisation must inform the European Commission about the marketing plans for the medicinal product authorised by this decision.

- **Periodic safety update reports (PSURs)**

The requirements for submission of PSURs for this medicinal product are set out in the list of Union reference dates (EURD list) provided for under Article 107c(7) of Directive 2001/83/EC and any subsequent updates published on the European medicines web-portal.

D. CONDITIONS OR RESTRICTIONS WITH REGARD TO THE SAFE AND EFFECTIVE USE OF THE MEDICINAL PRODUCT

- **Risk management plan (RMP)**

The marketing authorisation holder (MAH) shall perform the required pharmacovigilance activities and interventions detailed in the agreed RMP presented in Module 1.8.2 of the marketing authorisation and any agreed subsequent updates of the RMP.

An updated RMP should be submitted:

- At the request of the European Medicines Agency;
- Whenever the risk management system is modified, especially as the result of new information being received that may lead to a significant change to the benefit/risk profile or as the result of an important (pharmacovigilance or risk minimisation) milestone being reached.

If the dates for submission of a PSUR and the update of a RMP coincide, they can be submitted at the same time.

B. PACKAGE LEAFLET

Package leaflet: Information for the user

Emtriva 200 mg hard capsules emtricitabine

Read all of this leaflet carefully before you start taking this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor or pharmacist.
- This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What Emtriva is and what it is used for
2. What you need to know before you take Emtriva
3. How to take Emtriva
4. Possible side effects
5. How to store Emtriva
6. Contents of the pack and other information

1. What Emtriva is and what it is used for

Emtriva is a treatment for Human Immunodeficiency Virus (HIV) infection in adults, children and infants aged 4 months and over. Emtriva 200 mg hard capsules are **only suitable for patients who weigh at least 33 kg**. Emtriva oral solution is available for people who have difficulty in swallowing Emtriva hard capsules.

Emtriva contains the active substance *emtricitabine*. This active substance is an *antiretroviral* medicine which is used to treat HIV infection. Emtricitabine is a *nucleoside reverse transcriptase inhibitor* (NRTI) which works by interfering with the normal working of an enzyme (reverse transcriptase) that is essential for the HIV virus to reproduce itself. Emtriva may lower the amount of HIV in the blood (viral load). It may also help to increase the number of T cells called CD4 cells. Emtriva should always be combined with other medicines to treat HIV infection.

You can still pass on HIV when taking this medicine, although the risk is lowered by effective antiretroviral therapy. Discuss with your doctor the precautions needed to avoid infecting other people.

This medicine is not a cure for HIV infection. While taking Emtriva you may still develop infections or other illnesses associated with HIV infection.

2. What you need to know before you take Emtriva

Do not take Emtriva

- **If you are allergic** to emtricitabine or any of the other ingredients of this medicine (listed in section 6).

→ If this applies to you, tell your doctor immediately.

Warnings and precautions

- **Tell your doctor if you have had kidney disease**, or if tests have shown problems with your kidneys. Before starting treatment, your doctor may order blood tests to assess kidney function and may advise you to take the capsules less often or prescribe Emtriva oral solution. Your doctor may also order blood tests during treatment to monitor your kidneys.
- **Talk to your doctor if you are over 65.** Emtriva has not been studied in patients over 65 years of age. If you are older than this and are prescribed Emtriva, your doctor will monitor you carefully.
- **Talk to your doctor if you have a history of liver disease, including hepatitis.** Patients with liver disease including chronic hepatitis B or C, who are treated with antiretrovirals, have a higher risk of severe and potentially fatal liver complications. If you have hepatitis B infection, your doctor will carefully consider the best treatment regimen for you. If you have a history of liver disease or chronic hepatitis B infection your doctor may conduct blood tests in order to carefully monitor liver function.
- **Look out for infections.** If you have advanced HIV disease (AIDS) and another infection, you may develop inflammation or worsening of the symptoms of infection when you start treatment with Emtriva. These may be signs that your body's improved immune system is fighting infection. If you notice signs of inflammation or infection soon after you start taking Emtriva, **tell your doctor at once.**

In addition to the opportunistic infections, autoimmune disorders (a condition that occurs when the immune system attacks healthy body tissue) may also occur after you start taking medicines for the treatment of your HIV infection. Autoimmune disorders may occur many months after the start of treatment. If you notice any symptoms of infection or other symptoms such as muscle weakness, weakness beginning in the hands and feet and moving up towards the trunk of the body, palpitations, tremor or hyperactivity, please inform your doctor immediately to seek necessary treatment.

- **Bone problems.** Some patients taking combination antiretroviral therapy may develop a bone disease called osteonecrosis (death of bone tissue caused by loss of blood supply to the bone). The length of combination antiretroviral therapy, corticosteroid use, alcohol consumption, severe immunosuppression, higher body mass index, among others, may be some of the many risk factors for developing this disease. Signs of osteonecrosis are joint stiffness, aches and pains (especially of the hip, knee and shoulder) and difficulty in movement. If you notice any of these symptoms please inform your doctor.

Children and adolescents

Do not give Emtriva to infants under 4 months of age.

Other medicines and Emtriva

You should not take Emtriva if you are already taking other medicines that contain emtricitabine or lamivudine, which are also used to treat HIV infection, unless otherwise directed by your doctor.

Tell your doctor or pharmacist if you are taking, have recently taken or might take any other medicines.

Do not stop your treatment without contacting your doctor.

Pregnancy and breast-feeding

If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor or pharmacist for advice before taking this medicine.

If you have taken Emtriva during your pregnancy, your doctor may request regular blood tests and other diagnostic tests to monitor the development of your child. In children whose mothers took NRTIs during pregnancy, the benefit from the protection against HIV outweighed the risk of side effects.

- **Do not breast-feed if you are taking Emtriva.** This is because the active substance in this medicine passes into human breast milk. It is known that the virus can be passed to the baby in breast milk.

Driving and using machines

Emtriva may cause dizziness. If you experience dizziness while taking Emtriva, **do not drive** and do not use any tools or machines.

3. How to take Emtriva

- **Always take this medicine exactly as your doctor has told you.** Check with your doctor or pharmacist if you are not sure.

The recommended dose is:

- **Adults: one 200 mg hard capsule, each day with or without food.** Swallow the hard capsule with a glass of water.
- **Children and adolescents up to 18 years of age** who weigh at least 33 kg and who are able to swallow hard capsules: one 200 mg hard capsule, each day with or without food.

For infants from 4 months, children, and patients who are unable to swallow hard capsules and patients with kidney problems, Emtriva is available as a liquid (an oral solution). If you have difficulty in swallowing the capsules, tell your doctor.

- **Always take the dose recommended by your doctor.** This is to make sure that your medicine is fully effective, and to reduce the risk of developing resistance to the treatment. Do not change the dose unless your doctor tells you to.
- **If you have problems with your kidneys,** your doctor may advise you to take Emtriva less frequently.
- **Your doctor will prescribe Emtriva with other antiretroviral medicines.** Please refer to the package leaflets of the other antiretrovirals for guidance on how to take those medicines.

If you take more Emtriva than you should

If you accidentally take too many Emtriva hard capsules, contact your doctor or nearest emergency department for advice. Keep the carton with you so that you can easily describe what you have taken.

If you forget to take Emtriva

It is important not to miss a dose of Emtriva.

If you do miss a dose of Emtriva within 12 hours of when it is usually taken, take it as soon as you can, and then take your next dose at its regular time.

If it is almost time (less than 12 hours) for your next dose anyway, forget about the missed dose. Wait and take the next dose at the regular time. Do not take a double dose to make up for a forgotten hard capsule.

If you are sick (*vomit*)

If it's less than an hour since you took Emtriva, take another capsule. You do not need to take another capsule if you were sick more than an hour after taking Emtriva.

If you stop taking Emtriva

- **Don't stop taking Emtriva without talking to your doctor.** Stopping treatment with Emtriva may reduce the effectiveness of the anti-HIV therapy recommended by your doctor. Speak with your doctor before you stop, particularly if you are experiencing any side effects or you have another illness. Contact your doctor again before you restart taking Emtriva capsules.
- **If you have both HIV infection and hepatitis B**, it is especially important not to stop your Emtriva treatment without talking to your doctor first. Some patients have had blood tests or symptoms indicating that their hepatitis has got worse after stopping Emtriva. You may require blood tests for several months after stopping treatment. In some patients with advanced liver disease or cirrhosis, stopping treatment is not recommended as this may lead to worsening of hepatitis.

Tell your doctor immediately about new or unusual symptoms after you stop treatment, particularly symptoms you associate with hepatitis B infection.

If you have any further questions on the use of this medicine, ask your doctor or pharmacist.

4. Possible side effects

During HIV therapy there may be an increase in weight and in levels of blood lipids and glucose. This is partly linked to restored health and life style, and in the case of blood lipids sometimes to the HIV medicines themselves. Your doctor will test for these changes.

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Tell your doctor about any of the following side effects:

Most frequent side effects

The following side effects are **very common** (these can affect at least 10 in every 100 patients):

- headache, diarrhoea, feeling sick (*nausea*)
- muscle pain and weakness (if creatine kinase levels in the blood are increased)

Other possible side effects

The following side effects are **common** (these can affect up to 10 in every 100 patients):

- dizziness, weakness, difficulty sleeping, abnormal dreams
- being sick (*vomiting*), problems with digestion resulting in discomfort after meals, stomach pain
- rashes (including red spots or blotches sometimes with blistering and swelling of the skin), which may be allergic reactions, itching, changes in skin colour including darkening of the skin in patches
- pain

Tests may also show:

- low white blood cell count (a reduced white blood cell count can make you more prone to infection)
- increased triglycerides (fatty acids), bile or sugar in the blood
- liver and pancreas problems

The following side effects are **uncommon** (these can affect up to 1 in every 100 patients):

- anaemia (low red blood cell count)
- swelling of the face, lips, tongue or throat

Other possible effects

Children given emtricitabine also experienced **changes in skin colour** including darkening of the skin in patches, very commonly and **anaemia** (low red blood cell count), commonly. If the production of red blood cells is reduced, a child may have symptoms of tiredness or breathlessness.

Reporting of side effects

If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via **the national reporting system listed in Appendix V**. By reporting side effects you can help provide more information on the safety of this medicine.

5. How to store Emtriva

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the bottle, blister pack and carton after "EXP". The expiry date refers to the last day of that month.

This medicine does not require any special storage conditions.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. Contents of the pack and other information

What Emtriva contains

- **The active substance is *emtricitabine*.** Each Emtriva hard capsule contains 200 mg of emtricitabine.
- **The other ingredients are:**

Capsule contents: microcrystalline cellulose (E460), crospovidone, magnesium stearate (E572), povidone (E1201)

Capsule shell: gelatin, indigotine (E132), titanium dioxide (E171)

Printing ink containing: black iron oxide (E172), shellac (E904)

What Emtriva looks like and contents of the pack

Emtriva hard capsules have a white opaque body with a light blue opaque cap. Each capsule is printed with “200 mg” on the cap and “GILEAD” and [Gilead logo] on the body in black ink. Emtriva comes in bottles or blister packs containing 30 capsules.

Emtriva is also available as an oral solution for use in children and infants aged 4 months and over, patients who have difficulty in swallowing and patients with kidney problems. There is a separate Package Leaflet for Emtriva 10 mg/mL oral solution.

Package leaflet: Information for the user

Emtriva 10 mg/mL oral solution emtricitabine

Read all of this leaflet carefully before you start taking this medicine because it contains important information for you.

- Keep this leaflet. You may need to read it again.
- If you have any further questions, ask your doctor or pharmacist.
- This medicine has been prescribed for you only. Do not pass it on to others. It may harm them, even if their signs of illness are the same as yours.
- If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. See section 4.

What is in this leaflet

1. What Emtriva is and what it is used for
2. What you need to know before you take Emtriva
3. How to take Emtriva
4. Possible side effects
5. How to store Emtriva
6. Contents of the pack and other information

1. What Emtriva is and what it is used for

Emtriva is a treatment for Human Immunodeficiency Virus (HIV) infection in adults, children and infants aged 4 months and over. Emtriva oral solution is particularly suitable for people who have difficulty in swallowing Emtriva hard capsules.

Emtriva contains the active substance *emtricitabine*. This active substance is an *antiretroviral* medicine which is used to treat HIV infection. Emtricitabine is a *nucleoside reverse transcriptase inhibitor* (NRTI) which works by interfering with the normal working of an enzyme (reverse transcriptase) that is essential for the HIV virus to reproduce itself. Emtriva may lower the amount of HIV in the blood (viral load). It may also help to increase the number of T cells called CD4 cells. Emtriva should always be combined with other medicines to treat HIV infection.

You can still pass on HIV when taking this medicine, although the risk is lowered by effective antiretroviral therapy. Discuss with your doctor the precautions needed to avoid infecting other people.

This medicine is not a cure for HIV infection. While taking Emtriva you may still develop infections or other illnesses associated with HIV infection.

2. What you need to know before you take Emtriva

Do not take Emtriva

- **If you are allergic** to emtricitabine or any of the other ingredients of this medicine (listed in section 6).

→ If this applies to you, tell your doctor immediately.

Warnings and precautions

- **Tell your doctor if you have had kidney disease**, or if tests have shown problems with your kidneys. Before starting treatment, your doctor may order blood tests to assess kidney function and may advise you to take a reduced dose of the oral solution or prescribe Emtriva hard capsules. Your doctor may also order blood tests during treatment to monitor your kidneys.
- **Talk to your doctor if you are over 65.** Emtriva has not been studied in patients over 65 years of age. If you are older than this and are prescribed Emtriva, your doctor will monitor you carefully.
- **Talk to your doctor if you have a history of liver disease, including hepatitis.** Patients with liver disease including chronic hepatitis B or C, who are treated with antiretrovirals, have a higher risk of severe and potentially fatal liver complications. If you have hepatitis B infection, your doctor will carefully consider the best treatment regimen for you. If you have a history of liver disease or chronic hepatitis B infection your doctor may conduct blood tests in order to carefully monitor liver function.
- **Look out for infections.** If you have advanced HIV disease (AIDS) and another infection, you may develop inflammation or worsening of the symptoms of infection when you start treatment with Emtriva. These may be signs that your body's improved immune system is fighting infection. If you notice signs of inflammation or infection soon after you start taking Emtriva, **tell your doctor at once.**

In addition to the opportunistic infections, autoimmune disorders (a condition that occurs when the immune system attacks healthy body tissue) may also occur after you start taking medicines for the treatment of your HIV infection. Autoimmune disorders may occur many months after the start of treatment. If you notice any symptoms of infection or other symptoms such as muscle weakness, weakness beginning in the hands and feet and moving up towards the trunk of the body, palpitations, tremor or hyperactivity, please inform your doctor immediately to seek necessary treatment.

- **Bone problems.** Some patients taking combination antiretroviral therapy may develop a bone disease called osteonecrosis (death of bone tissue caused by loss of blood supply to the bone). The length of combination antiretroviral therapy, corticosteroid use, alcohol consumption, severe immunosuppression, higher body mass index, among others, may be some of the many risk factors for developing this disease. Signs of osteonecrosis are joint stiffness, aches and pains (especially of the hip, knee and shoulder) and difficulty in movement. If you notice any of these symptoms please inform your doctor.

Children and adolescents

Do not give Emtriva to infants under 4 months of age.

Other medicines and Emtriva

You should not take Emtriva if you are already taking other medicines that contain emtricitabine or lamivudine, which are also used to treat HIV infection, unless otherwise directed by your doctor.

Tell your doctor or pharmacist if you are taking, have recently taken or might take any other medicines.

Do not stop your treatment without contacting your doctor.

Pregnancy and breast-feeding

If you are pregnant or breast-feeding, think you may be pregnant or are planning to have a baby, ask your doctor or pharmacist for advice before taking this medicine.

If you have taken Emtriva during your pregnancy, your doctor may request regular blood tests and other diagnostic tests to monitor the development of your child. In children whose mothers took NRTIs during pregnancy, the benefit from the protection against HIV outweighed the risk of side effects.

- **Do not breast-feed if you are taking Emtriva.** This is because the active substance in this medicine passes into human breast milk. It is known that the virus can be passed to the baby in breast milk.

Driving and using machines

Emtriva may cause dizziness. If you experience dizziness while taking Emtriva, **do not drive** and do not use any tools or machines.

Emtriva oral solution contains:

Sunset yellow (E110) may cause allergic reactions. The methyl parahydroxybenzoate (E218) and propyl parahydroxybenzoate (E216) may cause allergic reactions (possibly delayed). This medicine contains 36 mg of sodium (main component of cooking/table salt) per 24 mL dose. This is equivalent to 1.8% of the recommended maximum daily dietary intake of sodium for an adult.

This medicine also contains 480 mg propylene glycol per 24 mL (maximum single dose) which is equivalent to a maximum of 12 mg/kg/day.

3. How to take Emtriva

- **Always take this medicine exactly as your doctor has told you.** Check with your doctor or pharmacist if you are not sure.

The recommended dose is:

- **Adults:** Your doctor will advise the correct amount of Emtriva oral solution to be taken. Emtriva oral solution can be taken with or without food.
- **Infants, children and adolescents weighing 40 kg or less:** the dose of Emtriva 10 mg/mL oral solution is calculated according to your body weight. Examples of body weight and the corresponding doses and volumes of the oral solution to be taken each day are given in the table below:

Body weight (kg)	Per day	
	Emtricitabine dose (mg)	How much 10 mg/mL solution to take (mL)
5 kg	30 mg	3 mL
10 kg	60 mg	6 mL
15 kg	90 mg	9 mL
20 kg	120 mg	12 mL
25 kg	150 mg	15 mL
30 kg	180 mg	18 mL
35 kg	210 mg	21 mL
40 kg	240 mg	24 mL

Make sure that you understand how to measure and give the right amount of oral solution according to the weight of the person being treated. Use the measuring cup provided in the carton to measure the correct dose. The cup has lines to indicate each mL of solution.

If you are unsure how much Emtriva you should take ask your doctor or pharmacist.

- **Always take the dose recommended by your doctor.** This is to make sure that your medicine is fully effective, and to reduce the risk of developing resistance to the treatment. Do not change the dose unless your doctor tells you to.
- **If you have problems with your kidneys,** your doctor may advise you to take Emtriva less frequently.
- **Your doctor will prescribe Emtriva with other antiretroviral medicines.** Please refer to the package leaflet of the other antiretrovirals for guidance on how to take those medicines.

Emtriva is also available as hard capsules. These are only suitable for patients who weigh at least 33 kg and can swallow hard capsules. The blood levels obtained after taking one Emtriva 200 mg hard capsule are similar to those obtained after taking 24 mL of the oral solution. If you would like to switch from taking Emtriva oral solution to Emtriva hard capsules, please talk to your doctor.

If you take more Emtriva than you should

If you accidentally take too much Emtriva oral solution, contact your doctor or nearest emergency department for advice. Keep the oral solution bottle with you so that you can easily describe what you have taken.

If you forget to take Emtriva

It is important not to miss a dose of Emtriva.

If you do miss a dose of Emtriva within 12 hours of when it is usually taken, take it as soon as you can, and then take your next dose at its regular time.

If it is almost time (less than 12 hours) for your next dose anyway, forget about the missed dose. Wait and take the next dose at the regular time. Do not take a double dose to make up for a forgotten dose.

If you are sick (*vomit*)

If it's less than an hour since you took Emtriva, take another dose. You do not need to take another dose if you were sick more than an hour after taking Emtriva.

If you stop taking Emtriva

- **Don't stop taking Emtriva without talking to your doctor.** Stopping treatment with Emtriva may reduce the effectiveness of the anti-HIV therapy recommended by your doctor. Speak with your doctor before you stop, particularly if you are experiencing any side effects or you have another illness. Contact your doctor again before you restart taking Emtriva oral solution.
- **If you have both HIV infection and hepatitis B,** it is especially important not to stop your Emtriva treatment without talking to your doctor first. Some patients have had blood tests or symptoms indicating that their hepatitis has got worse after stopping Emtriva. You may require blood tests for several months after stopping treatment. In some patients with advanced liver disease or cirrhosis, stopping treatment is not recommended as this may lead to worsening of hepatitis.

Tell your doctor immediately about new or unusual symptoms after you stop treatment, particularly symptoms you associate with hepatitis B infection.

If you have any further questions on the use of this medicine, ask your doctor or pharmacist.

4. Possible side effects

During HIV therapy there may be an increase in weight and in levels of blood lipids and glucose. This is partly linked to restored health and life style, and in the case of blood lipids sometimes to the HIV medicines themselves. Your doctor will test for these changes.

Like all medicines, this medicine can cause side effects, although not everybody gets them.

Tell your doctor about any of the following side effects:

Most frequent side effects

The following side effects are **very common** (these can affect at least 10 in every 100 patients):

- headache, diarrhoea, feeling sick (*nausea*)
- muscle pain and weakness (if creatine kinase levels in the blood are increased)

Other possible side effects

The following side effects are **common** (these can affect up to 10 in every 100 patients):

- dizziness, weakness, difficulty sleeping, abnormal dreams
- being sick (*vomiting*), problems with digestion resulting in discomfort after meals, stomach pain
- rashes (including red spots or blotches sometimes with blistering and swelling of the skin), which may be allergic reactions, itching, changes in skin colour including darkening of the skin in patches
- pain

Tests may also show:

- low white blood cell count (a reduced white blood cell count can make you more prone to infection)
- increased triglycerides (fatty acids), bile or sugar in the blood
- liver and pancreas problems

The following side effects are **uncommon** (these can affect up to 1 in every 100 patients):

- anaemia (low red blood cell count)
- swelling of the face, lips, tongue or throat

Other possible effects

Children given emtricitabine also experienced **changes in skin colour** including darkening of the skin in patches, very commonly and **anaemia** (low red blood cell count), commonly. If the production of red blood cells is reduced, a child may have symptoms of tiredness or breathlessness.

Reporting of side effects

If you get any side effects, talk to your doctor or pharmacist. This includes any possible side effects not listed in this leaflet. You can also report side effects directly via [the national reporting system listed in Appendix V](#). By reporting side effects you can help provide more information on the safety of this medicine.

5. How to store Emtriva

Keep this medicine out of the sight and reach of children.

Do not use this medicine after the expiry date which is stated on the bottle and carton after “EXP”. The expiry date refers to the last day of that month.

Store in a refrigerator (2°C – 8°C) until opened.

After opening the bottle, do not store above 25°C. The content of the bottle should be used up within 45 days of opening. It is advised to write the date of removal from the refrigerator on the package.

If there is any solution left in the bottle after 45 days, this should be disposed of in accordance with local requirements or returned to the pharmacy.

Do not throw away any medicines via wastewater or household waste. Ask your pharmacist how to throw away medicines you no longer use. These measures will help protect the environment.

6. Contents of the pack and other information

What Emtriva contains

- **The active substance is *emtricitabine*.** One mL of Emtriva oral solution contains 10 mg of emtricitabine (10 mg/mL).
- **The other ingredients are:** cotton candy flavouring, disodium edetate, hydrochloric acid, methyl parahydroxybenzoate (E218), propylene glycol, propyl parahydroxybenzoate (E216), sodium hydroxide, sodium phosphate monobasic hydrate, sunset yellow (E110), purified water, xylitol (E967).

What Emtriva looks like and contents of the pack

Emtriva oral solution is a clear, orange to dark orange solution that comes in bottles containing 170 mL with a measuring cup.

Emtriva is also available as hard capsules. These are only suitable for patients who weigh at least 33 kg and can swallow hard capsules. There is a separate Package Leaflet for Emtriva 200 mg hard capsules.
